

Gen AI Documentation

Date Used: February 23th, 2026

Tool disclosure: AI Agent on Visual Studio Code (CoPilot)

Purpose of Use: To explore AI assisted coding and help build a reflective, meditative scrolling experience with multiple layers. The goal was to learn how to vibecode an interactive visual experience using minimal assets.

Summary of Interaction: I used the AI agent to help write the code for the fog walk scene. This included creating the fog layers, animating them, and adding background elements like a house and a person figure.

Human Decision Points:

- Specifying the number of fog layers and their opacity (+ blur and speed)
- Decided the placement, size, and colour of the house and person figure so they could remain visible
- Adjusted the world movement so the scene felt calm
- Chose which elements to animate (cars) versus static objects (human figure)

Scope of GenAI Use: GenAI was used to write all of the code and comments. GenAI was not used to write any of the project descriptions, reflections, or Read Me content.

Limitations or Misfires:

- Many initial prompts produced background elements that were either too small or positioned behind the fog layers, making them invisible or hard to see
- The AI sometimes layered the fog incorrectly or made the fog movement too fast that it felt unnatural
- Some elements needed trial and error repositioning and manual adjustments to get the right visual hierarchy (the cars were moving through and above the house)

Summary of Process (Human + Tool)

- Prompting and iteration
- Testing the visibility
- Moments of failure
- Manual adjustments

Decision Points & Trade-offs

- I had to manually adjust the element sizes and layering to make sure the house and person were visible without breaking the fog effect
- I experimented with different horizontal speeds for each fog layer
- I decided to keep the motion automatic rather than interactive because I wanted it to be more of a meditative and reflective experience
- I used simple and basic CSS design to prioritize the atmospheric feeling over realism

Verification & Judgement

- I verified and judged the AI outputs by running the scene in the browser and observing the pacing, layering, and visibility of all the elements
 - I kept making adjustments until the fog, house, and person appeared correctly in the way I had intended, and it felt natural and conveyed a calm mood.
-

Appendix

build a simple web page called "In the Fog".
It should show an endless and slow horizontal scroll through layers of fog.
Use a soft airy gray gradient background. (Dark gray to light gray)
Add 3 fog layers with different opacities, blurs, and horizontal movement speeds. The
The scene uses javascript to animate.
It should feel calm and slightly lonely.
Use HTML, Javascript, CSS and set up the basic structure so that the scene automatically animates when its opened inthe browser.

Sure, here's a proposed directory structure for a web project app:

```
└─ in-the-fog
  └─ src
    ├── index.html
    ├── styles
    │   └─ # main.css
    ├── scripts
    │   └─ JS fog.js
    └─ README.md
```

Make a full-screen "camera" container and set up the background.

⚠ You have exceeded your premium request allowance. We have automatically switched you to GPT-4.1 which is included with your plan. [Enable additional paid premium requests](#) to continue using premium models.

✓ Edited `index.html` +2 -1

✓ Edited `main.css` +22 -0

The full-screen "camera" container has been added to the HTML, and a soft gray gradient background is set up in the CSS. The page is now ready for the fog animation layers. Let me know if you'd like to proceed with the fog animation or need adjustments!

Set a linear gradient background (dark gray top → light gray bottom).

✓ Edited `main.css` +1 -1

The background for the "camera" container is now a vertical linear gradient, transitioning from dark gray at the top to light gray at the bottom. The scene is ready for the fog layers. Let me know if you'd like to continue!

I want to stack utiple semi-transparent layers for depth. Create a div class="fog-layer" and position each fog layer absolute, full width and full height. Add a white background with a super small opacity like 0.3

✓ Edited index.html +5 -1

✓ Edited main.css +9 -0

Three semi-transparent fog layers have been added inside the camera container. Each layer is absolutely positioned, full width and height, with a soft white background at 0.3 opacity for depth. Ready for animation and further styling!

make the layers move at different speeds to simulate drifting fog. and loop it so the fog drifts infinitely

✓ Edited index.html +1 -0

✓ Edited fog.js +34 -1

The fog layers now drift horizontally at different speeds, looping infinitely to create a calm, endless fog effect. The animation starts automatically when the page loads. Let me know if you want to adjust the look or add more atmosphere!

can you make the fog feel more alive and realistic? maybe make each fog layer move slightly up and down like a wave. or make it more atmospheric by adding a gradual background color shift like over time the gradient gets darker

✓ Read fog.js file lines 1 to 46

✓ Edited fog.js +28 -21

The fog layers now move with both horizontal drifting and gentle vertical wave motion, making the fog feel more alive. Additionally, the background gradient gradually darkens and lightens over time, enhancing the atmospheric effect. Open the page to see the improved, more realistic and moody fog

include a small house sturcture in the background. Rectangle for the walls, triangle for the roof, two small windows. The house should be kind of transparent to match the fog. and the house should move with the fog layer so it feels like a part of the world

✓ Edited index.html +11 -1

✓ Edited main.css +4 -0

✓ Edited fog.js +6 -0

A small, semi-transparent house has been added to the background, built with SVG shapes for the walls, roof, and windows. The house moves with the back fog layer, blending into the scene and matching the fog's atmosphere. Let me know if you want to adjust its look or position!

i dont see the house. the house should still be visable in the fog

✓ Edited index.html +5 -5

✓ Edited main.css +1 -0

The house is now more visible in the fog: its opacity and color have been increased, and it is rendered above the fog layer's white fill. You should now see the house gently drifting with the fog, while still blending into the atmospheric scene. Let me know if you want further adjustments!

Restore Checkpoint

where is the house?

The house is an SVG graphic placed inside the first (back) fog layer. It is positioned near the bottom left of the screen (using left: 10vw; bottom: 10vh;), and it moves with the fog to blend into the scene. If you still do not see it, try refreshing the page or checking that the fog layers and house SVG are present in your HTML. If you want the house in a different location or more prominent, let me know!

make the house position absolute
50px from the bottom (it should sit on the ground), 800px from the left, and make it 80x60px

✓ Edited `index.html` +1 -1

The house is now absolutely positioned 50px from the bottom, 800px from the left, and sized at 80x60px. It should now sit clearly on the "ground" and be visible in the fog scene. Let me know if you need further adjustments!

GPT-4.1 · 0x

i still cant see the house, can you change its colour for now so i can see where it is on the screen

✓ Edited `index.html` +5 -5

The house is now colored bright red with yellow windows, making it very easy to spot on the screen. This will help you locate its position in the scene. Let me know when you'd like to revert to a more atmospheric color!

make the house a lot bigger, and not as blurred

✓ Edited `index.html` +1 -1

✓ Edited `main.css` +1 -0

The house is now much larger and significantly less blurred, making it prominent and easy to see in the scene. Its position is also adjusted to keep it grounded and visible. Let me know if you want to fine-tune its appearance or restore the atmospheric colors!

make it less blurred, make the house a brick red colour, and the windows a warm light colour

✓ Edited `index.html` +4 -4

✓ Edited `main.css` +1 -1

The house is now a brick red color with a much lower blur, and the windows have a warm light yellow glow. This should make the house look inviting and clear while still fitting the foggy atmosphere. Let me know if you want any more tweaks!

the house is still too blurred

✓ Edited `main.css` +1 -1

The blur has been completely removed from the house, so it will now appear crisp and clear in the scene. Let me know if you need any more adjustments!

maybe its a problem with the fog, the house looks very foggy and you can barely see it

✓ Edited `fog.js` +6 -1

The back fog layer (where the house sits) is now much more transparent, making the house stand out and appear less foggy. The other fog layers remain atmospheric. You should now see the house much more clearly in the scene. Let me know if you need further adjustments!

have the house start center

✓ Edited `index.html` +1 -1

The house now starts perfectly centered horizontally on the screen and sits 50px from the bottom. It will remain centered as it drifts with the fog. Let me know if you need any more adjustments!

add some trees on the same ground level as the house, randomly spread out

✓ Edited `index.html` +21 -0

Five trees have been added as SVGs at the same ground level as the house, randomly spread out across the scene. They are styled to match the atmosphere and will move with the fog layer, helping the world feel more alive. Let me know if you want to adjust their appearance or placement!

Restore Checkpoint

make the lightest grey fog layer less foggy/blurred

✓ Edited `fog.js` +2 -2

The lightest (front) fog layer is now less foggy and less blurred, making the scene clearer and less obscured. Let me know if you want to fine-tune the effect further!

Have a person figure shadow positioned bottom left of the screen, the figure should take up 1/4 of the screen like 3rd person perspective looking into the distance.

✓ Edited `index.html` +13 -0

A large person shadow (silhouette) has been added to the bottom left of the screen, taking up about 1/4 of the viewport in a 3rd person perspective, looking into the distance. The figure is styled as a dark shadow to fit the foggy scene. Let me know if you want to adjust its size, shape, or position!

we should only see the personas upper body and head. it should start at the bottom of the screen 0px

✓ Edited `index.html` +6 -9

Now, only the upper body and head of the person shadow are visible, starting right at the bottom of the screen. The lower body and legs are no longer shown, creating a 3rd person perspective looking into the fog. Let me know if you want further adjustments!

GPT-4.1 · 0x

no arms, and the body should continue out from the bottom of the screen, no gaps

✓ Edited `index.html` +2 -5

The person shadow now has no arms, and the body rectangle extends out the bottom of the screen with no gaps, creating a seamless silhouette from the head down. Let me know if you need any more adjustments!

make the body slightly wider

✓ Edited `index.html` +2 -2

The person's body is now slightly wider, giving the silhouette a more natural and grounded appearance. Let me know if you want any further tweaks!

add a car driving through the fog that goes from right to left of the screen.

✓ Edited `index.html` +15 -0

✓ Edited `fog.js` +22 -0

A car has been added to the scene and will now drive from right to left through the fog, looping continuously. The animation is handled in JavaScript, and the car appears above the fog layers. Let me know if you want to adjust its speed, appearance, or position!

GPT-4.1 · 0x

the car should be below the fog layers, and make is slightly larger

✓ Edited `index.html` +2 -2

✓ Edited `fog.js` +1 -1

The car is now larger and appears below the fog layers, making it look like it's driving through the fog. Its animation and position have been updated accordingly. Let me know if you want any further adjustments!

the car is not visible, put it on the same layer as the houses and trees.

✓ Edited `index.html` +15 -15

The car SVG is now placed in the same fog layer as the house and trees, ensuring it appears together with them and is visible in the scene. The animation will continue to move the car from right to left through the fog. Let me know if you need any more adjustments!

add 2 more cars, one going right to left.

✓ Edited `index.html` +31 -0

✓ Edited `fog.js` +57 -17

There are now three cars in the scene: two moving right to left and one moving left to right, each on the same layer as the house and trees. Each car has its own color, position, and animation speed for a lively, atmospheric effect. Let me know if you want to adjust their appearance or behavior!

the cars should all be on the same ground level. and they should go in front of the house.

✓ Edited `index.html` +3 -3

All cars are now aligned to the same ground level (bottom: 50px) and have a higher z-index, so they appear in front of the house and trees. This creates a more realistic scene with cars driving past the house. Let me know if you need any more adjustments!

the human figure should be above the fog layers, and a dark silhouette

✓ Edited `index.html` +4 -3

The human figure is now above all fog layers, with a high z-index and a darker silhouette color for a strong, clear presence in the scene. Let me know if you need any more adjustments!
